

# Smoke Control - It's not Just for High-Rises

**ILLINOIS FIRE INSPECTORS ASSOCIATION**

May 1, 2015

Presented by  
*Craig R. Studer, P.E. &*  
**JENSEN HUGHES, Inc.**

www.jensenhughes.com

---

---

---

---

---

---

---

---

## Overview

1. Intro to Smoke Control Requirements
2. Intro to Smoke Control Design
3. Pitfalls and Lessons Learned
4. After Certificate of Occupancy

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 1. Smoke Control Requirements

Early Prescriptive Requirements (up to early 1990's)

- Air Changes
- Operable Windows

Current Prescriptive Requirements

- Passive or active smoke control
- Based on design fire and specific guidelines for feature being protected

Performance Requirements

- Establish Performance Goals
- Outline Design Method
  - Acceptance Testing Requirements

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 1. Where is Smoke Control Required?

- Atria / Covered Malls
- High Rise Buildings
  - Smokeproof Exit Enclosures-Section 403 (909)
  - Elevator hoistway pressurization alt – Section 707.14
- Underground Buildings
- Smoke Protected Assembly Seating (& Stages)
- Institutional Group 3 Windowless Compartments

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Methods of Smoke Control

Pressurization method 909.6

Airflow method 909.7

Exhaust method 909.8

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Methods of Smoke Control

### Pressurization Method

- Maintain pressure difference across smoke barriers
  - Minimum 0.05 inch water gage
  - Maximum based on door opening/closing forces
- Pressure differentials are used to mitigate smoke spread

www.jensenhughes.com

Images from the Handbook of Smoke Control Engineering, 2017

---

---

---

---

---

---

---

---

## 2. Methods of Smoke Control

### Pressurization Method

- **Problems**
  - Building may be tighter than calculated
  - Oversizing fans means door opening problems
  - Balancing with stairs and other pressurization systems

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Methods of Smoke Control

### Airflow Method

- Typically used in combination with other methods
  - Difficult to accomplish in large openings

www.jensenhughes.com  
Images from NFPA 92B, 2009 Edition

---

---

---

---

---

---

---

---

## 2. Methods of Smoke Control

### EXHAUST METHOD

- Used for large enclosed volumes
  - Maintain smoke 6-ft above highest walking surface used for egress
- Require special approval

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Methods of Smoke Control

### Exhaust Method

- Make up air by natural or mechanical means is required
- Maximum make up air velocity – 200 fpm
- Exhaust high and supply low
- Plugholing
- Analyze balcony conditions

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Methods of Smoke Control

### Axisymmetric Plume

Prototypical plume  
Cone with tip at bottom  
Air entrained on all sides

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Methods of Smoke Control

Axisymmetric Plume

Result shows exhaust rate (fan size)

Problems:

- must know fire size
- very dependent on height
- does not address large area spaces (unique geometry)
- does not address dilution
- Conservative for tall, small spaces

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Methods of Smoke Control

### Balcony Spill Plume

www.jensenhughes.com

## 2. Smokeproof Enclosures

### Smokeproof Enclosures

- Three Options
  1. Open air vestibule or balcony
  2. Vestibule ventilation
  3. Stairwell pressurization

www.jensenhughes.com

## 2. Smokeproof Enclosures

### Open air vestibule or balcony

- Provide rated vestibule
- Minimum dimensions (44-in X 72-in)
- Exterior opening 16 SQ. FT

www.jensenhughes.com

## 2. Smokeproof Enclosures

### Vestibule ventilation

- Exhaust rate at 150% supply
- Stair pressurized to 0.10 in w.c.
- Smoke trap
- Location of vents

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Smokeproof Enclosures

### Stair Pressurization

- Pressures
  - Minimum 0.1 inch water gage
  - Maximum 0.35 inch water gage
  - Maximum based on door opening/closing force
- Injection points

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Smokeproof Enclosures

### Elevator Pressurization

- Allowed as exception to elevator lobbies
- Elevator pressurized 0.1 to 0.25 in w.c.
- Challenges when balancing other systems

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Performance Based Design Approach (Pressurization)

- Network Zone Model (ContamW)
  - Input flow paths, leakage, temperature differentials, weather
  - Simulate the impact of multiple systems on each other

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 2. Performance Based Design Approach

### CFD Models(Cons)

- Simulations can be computationally extensive.
- Significant effort required to build and evaluate model

### CFD Models(Pros)

- Provides a more accurate assessment of the smoke control system (more efficient designs)
- Make-up air can often be introduced at velocities greater than 200 FPM
- More design flexibility

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 3. Pitfalls

Smoke control systems are forever  
Smoke control system required  
Special Inspector  
Rational Analysis/Report  
Smoke barrier construction  
Opening protection  
Ventilated Vestibule  
Pressurized stairs  
Elevator Hoistways  
Leak testing of smoke control ducts

Fans  
Power systems  
Detection and control systems (positive confirmation)  
Control diagrams  
Firefighters' Smoke Control Panel  
Acceptance testing  
Smoke Control Inspection Report  
Final system acceptance  
After acceptance

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Smoke Control Systems are Forever

Smoke control systems require attention from project concept to past the C of O

Get involved at the beginning

Have a written procedure

Understand and come to agreement of smoke control system configuration.

Get help

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. In the Beginning

Smoke control system concept prior to submission for permit (exhaust and airflow).

ID of special inspector.

Verify concept on permit drawings

- Fan Schedules
- Matrix (Sequence of Operation)

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Smoke Control System Required

Responsibility of the design team

Don't assume

Should be obvious (atriums)

But not always (stair and elevator pressurization)

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Special Inspector

Sections 909.3 and 909.18.8

Qualifications (Section 1704.2.1)

- Fire Protection Engineering
- Mechanical Engineering
- Certified Air Balancer

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Special Inspector

Typically retained by the Owner

Always responsible to the AHJ

Prepares Test Plan

Should work early and closely with the construction team

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Special Inspector

Review design drawings

Review contractor drawings/data sheets

- Mechanical
- Electrical
- Sprinkler

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Special Inspector

Inspects systems as they are being installed.  
Tests completed systems  
Files inspection and test report with AHJ  
Assists AHJ during final acceptance

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Rational Analysis/Report

#### Section 909.4

- Stack effect
- Temperature effect of fire
- Wind effect
- HVAC systems
- Climate
- Duration of operation

Must be approved by AHJ (exhaust & airflow)

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Smoke Barrier Construction

#### Section 909.5

Minimum leakage

Door fan testing – passive systems

Door components

Penetrations

Get it done early!!!

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Opening Protection

Section 909.5.2

Self-closing

Automatic closing/opening devices

Latching or re-latching

Fire/smoke dampers

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Automatic Closing/Opening

Automatic closing doors or shutters activated by local smoke detector

- Sometimes, any alarm

Automatic opening doors

- Usually make-up air
- Security bypass
- Weekly test

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Latching/Relatching

Need to check after door is released and latched.

Pressure conditions can vary

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Fire/Smoke Dampers

- Must have access door.
- Verify free movement.
- Verify class
- Visually verify position during smoke control operation
- No fire sealant

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Ventilated Vestibule

- 909.20.4.2
- Verify air flow requirements
- Verify exhaust & supply grille location

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Pressurized Stairs

- Section 909.20.5
- 0.10 to 0.35 inches water column
- 15-pound door force (1008.1.3)
- Door sweeps
- Door guy
- Penetrations
- Elimination of barometric relief damper
- Still required by NFPA 101

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Elevator Hoistway Pressurization

909.21

In lieu of elevator lobbies

0.10 to 0.25 inches water column

Measured at midpoint each door

Verify door operation

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Leak Testing of Smoke Control Ducts

Section 909.10.2

Tested at 1.5 times maximum design pressure

Leakage shall not exceed 5% of design flow

Need documentation

Certified Test & Balance Contractor

Perform prior to installing dampers

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Fans

Section 909.10.5

1.15 service factor for fan motor

1.5 times the required belts

Minimum two belts

Letter from fan manufacturer

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Power Systems

Section 909.11  
Normal and Emergency  
Separate room  
Ventilation directly to outside

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Detection & Control Systems (Positive Confirmation)

Section 909.12  
Controls input/output signals  
UL 864, UUKL  
Actuation  
Manual override  
Power downstream of all disconnects  
Testing of equipment

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Positive Confirmation

Power downstream of all  
disconnects

- Current Sensor
- Switch position

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Positive Confirmation

Power downstream of all disconnects

- H-O-A switches
- VFDs
- MCC
- Normal and smoke control modes

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Positive Confirmation

Fans

- Belts off
- Current sensor
- Pressure switch
- Sail switch

Dampers, Doors and windows

- End switches
- Damper disconnects

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Control Diagrams

Section 909.15

Indicates all devices

- Sequencing
- Identification numbers

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Firefighters' Smoke Control Panel

Section 909.16

Fans, ducts, dampers and other equipment

- "Complex System" exemption

Individual status and control

Red, Green, Yellow AND White indicators

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. FF Smoke Control Panel

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. FF Smoke Control Panel

"On", "Off", "Open", "Close" and "Automatic" Control

Highest priority

Lock out

First Smoke Control Sequence Locks in

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. FF Smoke Control Panel

#### Initiation

- SC Panel switch in manual position
- SC fan/system switch in off position
- Cause alarm – no smoke control
- Turn system on

#### Overrides

- Duct detectors
- Freezestats
- Smoke control sequence

www.jensenhughes.com

---

---

---

---

---

---

---

---

www.jensenhughes.com

---

---

---

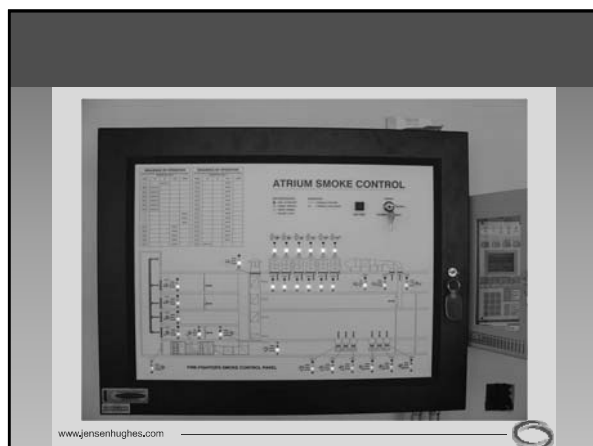

---

---

---

---

---

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Acceptance Testing

Section 909.18  
Fire alarm devices  
Dampers, fans and ducts  
Smoke barriers  
Controls  
Weekly self-test

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Acceptance Testing

Should be based on 909  
performance requirements  
Smoke bombs not  
realistic, but can show air  
flow

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Smoke Control Inspection Report

Section 909.18.8.3  
Devices and equipment  
Design/measured values  
Signature, stamp and date from the Engineer of  
Record  
Maintain in building/fire command room

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3. Final System Acceptance

Section 909.19  
Certificate of Occupancy, or lack thereof  
Phased openings  
Fully completed and operational

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 4. Are We Done?

System maintenance and testing  
Semi-annual required (NFPA 92A/B)  
Case histories

- 1 year installation
- 3 year installation
- 25 year installation

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 1 Year Installation

Passenger and freight elevator lobby doors did not close and latch.  
Smoke seals were missing.  
New penetrations were discovered that were not sealed.  
Three fans and three dampers were in fault on the smoke control panel.  
Some dampers were not closing on alarm.  
Several damper power junction boxes were missing covers and had wires hanging out.

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 3 Year Installation

We could not find a supposedly existing dedicated smoke exhaust fan. When we questioned the building engineer, he said the fan never operated, so they took it out.

Elevator lobby doors did not close and latch.

Stair vestibule doors did not close and latch. Some stair or vestibule doors couldn't close because the concrete floor had "heaved" and created a door stop.

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 25 Year Installation

The 12 story guest tower had 3 dampers per floor and a supply unit to provide make-up corridor air. On a floor alarm, the fan was supposed to shut down and dampers close. Fan did not shut down, only 9 of 30 dampers were operable (the rest stayed open). This deficiency created a condition similar to MGM Las Vegas fire over 20 years ago and killed many people from smoke migration far from the fire's origin.

None of the stair pressurization systems worked on alarm. Power wiring was disconnected on one system and fuses blown on another.

www.jensenhughes.com

---

---

---

---

---

---

---

---

### 25 Year Installation

The hotel's three story "atrium" (basement, first and second floor) had a smoke control system based on 6 air changes per hour. Current actual performance was poor because one required exhaust system was enclosed within wall construction on some previous renovation project. Also, several fans that were supposed to shut down and dampers close didn't and were inoperable.

www.jensenhughes.com

---

---

---

---

---

---

---

---

## 25 Year Installation

System was "tested" annually and passed each time, according to test certificates. You need more than just a fire alarm contractor to test these systems. Individual contractors are not familiar with how all portions of an integrated system work.

A controls contractor was modernizing the VAV box motor operators without acknowledging the smoke control system requirements (you guessed it, they arranged the fail-safe position opposite to the existing requirements).

[www.jensenhughes.com](http://www.jensenhughes.com)

---

---

---

---

---

---

---
